## 1 @T\_Tide

### 1.1 T\_Tide

wrapper for TPX0 generated tidal time series

### 1.2 build\_index

build a structure whose field names contain the index

### 1.3 from\_tpxo

read TPX0 output into tidetable object

### 1.4 get\_constituents

extract constituents of tpxo object

### 1.5 reorder

order constituents as specified by "name"

### 1.6 select

select a subset of constituents

## 1.7 shift\_time\_zone

shift phase according to time zone

## 2 @Tidal\_Envelope

### 2.1 Tidal\_Envelope

process tidal data to extrac the tidal envelope

### 2.2 init

initialize with data

## 3 @Tide\_wft

wavelet analysis of tidal data

### 3.1 Tide\_wft

wavelet transform of tidal time series

### 3.2 transform

wavelet transform tidal time series

input:

time : [1xn] abszissa of input vector, for example time, must be  
equally spaced

val : [1xn] signal, input data series (e.g water level or  
velocity)

F : [1xm] base frequencies, 1, 1, 2, ... for mean level,  
diurnal, semidirunal ...

base periods from base frequencies  $T=1/F$

n : [1xm] wavelet window length in multiple of periods

fc, nc : [scalar] low frequency cutoff and window length in periods

winstr : [char] fourier windows (kaiser (recommended), hanning, box  
, etc)

dt\_max : [scalar] maximum time to fill gaps in input data series (  
recommended 3/24 for tide)

```

output:
tide  : struct with fields
      w_coeff : [1xn] wavelet coefficients (complex)
      amplitude : amplitude
      phase    : phase
      range    :
      h_tide   :
      h_low    :
      h

```

## 4 @Tidetable

class for generating tidetable data

### 4.1 Tidetable

Tide table

### 4.2 analyze

extract tidal envelope from time series

### 4.3 export\_csv

export tide table to csv file

### 4.4 generate

run TPX0 to generate time series

### 4.5 generate\_tpxo\_input

generate tpxo input table  
 Note: superseded by perl script

## 4.6 import\_tpxo

import TPX0 data into tidetable object

## 4.7 plot\_neap\_spring

plot average neap and spring tide

# 5 tide

analysis prediction of tides in rivers and estuaries by empirical  
and theoretical methods

## 5.1 constituents

## 5.2 doodson

frequency of tidal constituents  
method of doodson  
source: wikipedia

## 5.3 envelope\_amplitude

compute envelopes of hw and low water

## 5.4 envelope\_slack\_water

slack water envelope of the tide

## 5.5 interval\_extrema

times and elevations for high and low water

## 5.6 interval\_extrema2

minimum and maximum within intervals of constant length,  
intended for periodic functions

## 5.7 interval\_zeros

times of slack water determined from velocity u

## 5.8 lunar\_phase

lunar phase

## 5.9 rayleigh\_criterion

rayleigh criterion for resolving tidal constituents  
 $T > 1/|f_1 - f_2|$

# 6 river-tide/@Bifurcation

## 6.1 Bifurcation

## 6.2 confluence\_rule

## 6.3 sediment\_division

## 6.4 sediment\_division\_geometric

## 7 river-tide/@River\_Tide

predict tide in a backwater affected river with a sloping/varying bed

Assumptions and capabilities:

- tidal dynamics follow the 1D-Shallow-Water-Equation (depth and cross-sectionally averaged Navier-Stokes-Equation)
- rectangular cross section
- width can vary along the channel
- friction coefficient (cd) constant along channel and over time (Chezy)
- advective acceleration term is considered, but can be deactivated
- vertical profile of streamwise velocity is constant (Boussinesq coefficient is unity (1))

Limitations / TODO list:

- single channel dynamics only (no tidal networks)
- no wind-shear stress (no storm surges)
- no tidal flats / intertidal areas (width constant in time)
- no flood-plain during high-river flow
- no stratification or along-channel salinity gradient
- negligible head loss in channel bends
- negligible feed-back of the sediment concentration on the propagation of the tide
- low Froude Number (no hydraulic jumps due to cataracts or tidal bores)
- At present, only two tidal components are supported (either D1 with D2 or D2 with D4, in addition to the mean water level z0),  
for mixed diurnal-semidiurnal cases with dominant semidiurnal component,  
the class has to be extended to support three components (D1, D2 and D4)
- At present, the tripel overtide is not computed (D3 for diurnal, D6 for semidiurnal tide),  
note that this is the main overtide for the case of low river flow
- At present, the 1/h non-linearity is only included in the approximations of  
the backwater curve, but not it's influence on the tidal frequency components

Method:

This class calls numerical solvers for second order ordinary differential equation boundary value problems

Tides is represented as exponential series in form of total discharge  $Q = \sum Q_i = Q_0 + Q_1 + Q_2$ , as discharge is conserved (balanced), the equations are simpler than for level  $z$  and velocity  $u$ , and the frequency components of  $z$  are straight forward determined by differentiation of  $Q$

Class and function structure:

```
River_Tide :
    computes river tide, provides the ode coefficients to
    the boundary value solver
bvp2c, bvp2fdm :
    solve the underlying second order boundary value
    problem
River_Tide_Map :
    provides convenient batch runs and processing of
    River_Tide instances
```

Minimum working example, c.f. example\_rive\_tide.m and example\_river\_tide\_map.m

input:

```
Q0    : scalar, river discharge (m3/s)
omega : scalar, angular frequency main tidal species in (1/
seconds)
x      : 2x1 vector, left and right end of computational
domain of the river (m)
w(x)   : function of width along the river (m)
cd(x)  : function of drag coefficient along the river (1)
zb(x)  : function of bed level along the river (m)

opt    : structure with options
opt.model_str = 'wave' (other solver are not supported at the
moment)
opt.solver = @bvp2c or @bvp2fdm
opt.nx : number of grid points along channel
opt.ns : base for logarithmic spacing of grid points, 1 :
linear spacing

bc : structure array of boundary conditions
    r, row 1..2 : left and right end, respectively
    c, column 1 : mean (river) component
                2..n : condition form column-1 frequency
                    component
```

```

(      q(1)*(p(1) y-(x0) + p(2) dy-/dx(x0) ...
+ q(2)*(p(1) y+(x0) + p(2) dy+/dx(x0) ) = bc(c
,r).val
      = val(0)

bc(c,r).var : Quantity, either 'z' or 'Q'
bc(c,r).val : complex amplitude of chosen variable
              (c.f. (1 + 0i) [m] for surface elevation
                amplitude of 1m)
              (value has to be real for mean component)
              mean component requires z and Q to be specified
                at opposit ends
bc(c,r).p : factor for Dirichlet p(1) or Neumann p(2)
           condition
           p = [1,0] : pure Dirichlet
           p = [0,1] : pure Neumann
           sum of abs(p) must be nonzero for each end and
             each frequency component
bc(c,r).q : factor for left and right going wave, only
           available for bvp2c
           q = [1,1] : total water level / discharge
           q = [1,0] : only left going wave
           q = [0,1] : only right going wave
           q has no meaning for the mean component and is
             ignored
           q is only supported by bvp2c,
           bvpfdm uses default q = [1,1]
           sum of abs(q) for each frequency component must
             be zero

```

## 7.1 River\_Tide

physical functions for computation of river tides in a single 1D  
channel  
combined with BVP-solver in child-classes to determine the  
hydrodynamics

## 7.2 check\_continuity

## 7.3 check\_momentum

## 7.4 d2au1\_dx2

second derivative of the tidal velocity magnitude

note: this is for finding zeros,  
the true derivative has to be scaled up by  $z$

## 7.5 d2az1\_dx2

second derivative of the tidal surface elevation

note: this is for finding zeros,  
the true derivative has to be scaled up by  $z$

## 7.6 decompose

decompose the tide into a right and left travelling wave,  
i.e. into incoming and reflected wave  
TODO subtract forcing term

## 7.7 dkq\_dx

along-channel derivative of the wave number of the discharge  
neglects width variation

TODO, rederive with  $g$  as variable

## 7.8 dkz\_dx

along channel derivative of the wave number of the tidal surface  
elevation  
ignores width variation  $dh/dx$  and second order depth variation ( $d^2h/dx^2$ )  
TODO rederive with  $g$  symbolic

## 7.9 even\_overtide\_analytic

## 7.10 friction\_coefficient

## 7.11 friction\_coefficient\_dronkers

friction coefficient according to Dronkers

the coefficients are semi-autogenerated

c.f. dronkers 1964

c.f. Cai 2016

```
p = [p0,p1,p2,p3];  
alpha =  $U_r/U_t$  = river velocity / tidal velocity amplitude =  $(u_{max} + u_{min}) / (u_{max} - u_{min})$ 
```

```
function p = friction_coefficient_dronkers(alpha,order)
```

## 7.12 friction\_coefficient\_godin

friction coefficient according to Godin

these coefficients are identical to Dronker's for  $U_R = \phi = 0$

```
function G = friction_coefficient_godin(obj,phi)
```

## 7.13 friction\_coefficient\_lorentz

friction coefficient according to Lorentz

identical to Dronker's coefficient for zero river flow  
and a single frequency component

c.f. Cai

c.f. Dronkers

```
function L = friction_coefficient_lorentz(obj,phi)
```

## 7.14 friction\_dronkers

friction determined by Dronker's method

input :

```

    u      : velocity time series
    Umid   : arithmetic mean of minimum and maximum velocity
            (not the mean of the velocity, usually non-zero even
            without river flow)
    Uhr    : half-range of the velocity, less than the sum of
            the frequency amplitudes, except at perigean spring
            tides

function [uau_sum uau p] = friction_dronkers(u,Umid,Uhr,order)

```

### 7.15 friction\_exponential\_dronkers

```

friction coefficients for the frequency components computed by
Dronkers method
c.f. Dronker's 1964 eq 8.2 and 8.4
Note: Cai denominates alpha as phi

function [c uau uau_ p] = friction_trigonometric_dronkers(u,dp,Umid
,Uhr,order,psym)

```

### 7.16 friction\_godin

```

compute friction with the method of Godin

```

### 7.17 friction\_lorentz

### 7.18 friction\_quadratic

```

friction determined by Dronker's method

```

### 7.19 friction\_trigonometric\_dronkers

```

friction computed by the method of Dronkers
expressed as coefficients for the frequency components
c.f. dronkers 1964 eq 8.2 and 8.4
Note: Cai denominates alpha as phi

```

## 7.20 friction\_trigonometric\_godin

friction computed by the method of Godin  
expressed as coefficients of the frequency components (  
trigonometric form)

```
function [c, uau] = friction_trigonometric_godin(obj,u,dp,Umax)
```

## 7.21 friction\_trigonometric\_lorentz

friction computed by the method of Lorent's  
expressed as coefficients of the frequency components (  
trigonometric form)

## 7.22 mwl\_offset

offset of the tidally averaged surface elevation caused by tidal  
friction  
Linear estimate of the mean water level offset (ignoring feed-back  
of tide)

## 7.23 mwl\_offset\_2

## 7.24 mwl\_offset\_analytic

## 7.25 odefun

coefficients of the backwater and wave equation for river-tides

## 7.26 odefunQ0

### 7.27 odefun\_advective\_acceleration

### 7.28 odefun\_friction

### 7.29 odefun\_ghof

### 7.30 odefun\_swe\_jacobian

Jacobian matrix indices of the Shallow-Water Equation  
 $d(A,Q)/dt + J(A,Q) d(A,Q)/dx = \text{forcing terms}$

$$\begin{bmatrix} 0, & 1 \\ -Q^2/A^2, & 2 Q/A \end{bmatrix} \begin{bmatrix} dA/dx \\ dQ/dx \end{bmatrix}$$

### 7.31 odefun\_width

### 7.32 odefunk

coefficients of the ordinary differential equation of the k-th  
frequency  
component of the tide

$$f1 Q'' + f2 Q' + f3 Q + f4 = 0$$

TODO rename f into c

TODO better pass dzb\_dx instead of dz0\_dx

TODO aa, oh and gh terms are not tested for width  $\sim 1$

### 7.33 odefunz0

coefficients of the backwater equation for the river tide  
TODO merge with backwater class

### 7.34 wave\_number\_analytic

analytic expression of the wave number of river tides

valid for both tidally, river dominated and low friction conditions  
and converging channels

k10 : complex wave number for k and z in a reach with constant  
width and bed slope

im(k) : damping modulus (rate of amplitude change)

re(k) : actual wave number (rate of phase change)

kq : wave number for Q for a reach with changing width and depth

kz : wave number for z for a reach with changing width and depth

c.f. derive\_wave\_number

### 7.35 wave\_number\_approximation

approximate wave number of the left and right traveling wave for  
variable coefficients

TODO merge with wave\_number\_analytic

function [k, k0, dk0\_dx\_rel, obj] = wave\_numer\_aproximation(obj)

## 8 river-tide/@River\_Tide\_BVP

### 8.1 River\_Tide\_BVP

hydrodynamics and morphodynamics of 1D tidal channel networks

### 8.2 bc\_transformation

transform arbitrary to cs-integrated discharge boundary condition

### 8.3 bcfun

Robin (mixed) boundary conditions for the river tide,  
supplied for each frequency component,  
wrapper that copies values are from the member struct "bc"

```

    q*(p*Q_1^- + (1-p)*dQ_1^-/dx
input :
    cid : channel index
    bif : 1,2 : index for left/right end of channel
    fid : frequency component index
           (1 = 0 omega (mean), 2 : 1 omega, 3 : 2 omega, ... )
columns of bc : frequency
rows of bc, left, right boundary
output :
    p : [2x1] linear combination of Dirichlet and Neumann
        boundary condition
    p(1) -> weight Dirichlet boundary condition
    p(2) -> weight Neumann boundary condition
    q linear combination of left and right travelling (incoming and
        outgoing) wave
    q(1) weight left going wave
    q(2) weight right going wave
    rhs = 0 -> homogeneous boundary condition

function [rhs, p, q, obj] = bcfun(obj,cid,bid,fid)

```

## 8.4 check\_continuity

compute residual for the continuity equation  
 $dA/dt + dQ/dx = Q_{in}$

## 8.5 check\_momentum

compute residual for the momentum equation  
 $dQ/dt + d/dx (Q^2/A) = -g A dz/dx - g A dw/dx - cd w |Q|/A^2$

## 8.6 decompose

decompose the tide into a right and left travelling wave,  
i.e. into incoming and reflected wave  
TODO subtract forcing term

## 8.7 discharge2level

determines tidal water surface amplitude (non-zero frequency components of surface elevation)  
from tidal discharge (non-zero frequency components of the discharge)

by continuity :

$$\begin{aligned} dz/dt + dq/dx &= 0 \\ \Rightarrow i \circ z &= - dq/dx \\ \Rightarrow z &= -1/(i\omega) dq/dx \\ \Rightarrow z &= 1i/\omega dq/dx \end{aligned}$$

## 8.8 dzb\_dt

change of bed level over time, when width constant over time  
 $dzb/dt + 1/(\rho w) dQs/dx = 0$

## 8.9 evolve\_bed\_level

evolve the bed level of the tidal river network over time

## 8.10 evolve\_bed\_level\_scenario

shortcut function for batch simulation runs

## 8.11 extract

extract values of individual variables from BVP-solver result vector

## 8.12 generate\_delft3d

generate a Delft3D 4 model for the channel network

### 8.13 init

initial condition  
function obj = init(obj)

### 8.14 initial\_value

### 8.15 odefun

coefficients of the backwater and wave equation for river-tides

### 8.16 postprocess

postprocess hydrodynamic solver

### 8.17 sediment\_transport

compute sediment transport for the channel network, including  
routing at  
junctions

### 8.18 sediment\_transport\_

compute sediment transport for a single channel

### 8.19 solve

determine hydrodynamics

## 9 river-tide/@River\_Tide\_Cai

Prediction of river tide by the method of Cai  
c.f. Cai 2013, Cai 2015

### 9.1 Gamma

Gamma parameter for tidal propagation  
c.f. Cai 2014

### 9.2 River\_Tide\_Cai

prediction of river tide by the method of Cai (2014)

### 9.3 river\_tide\_cai\_

determine the surface amplitude of the river-tide  
c.f. Cai

### 9.4 rt\_quantities

determine the quantities that determine the tidal propagation  
c.f. Cai

Note: this computes 4 unknowns following Cai, however,  
lambda, mu and epsilon can be substituted  
making it an equation in one unknown (delta) only

## 10 river-tide/@River\_Tide\_Empirical

Empirical fit to measurement and prediction (from tide at sea and  
river discharge)  
of the river tide

### 10.1 River\_Tide\_Empirical

class for fitting models to at-a-station time series of tidal  
elevation

## 10.2 fit\_amplitude

fit the oscillatory components

## 10.3 fit\_mwl

fit the tidally averaged water level

## 10.4 fit\_phase

fit the phase of the oscillatory components

## 10.5 fit\_range

fit the tidal range

## 10.6 predict\_amplitude

predict the oscillatory components

## 10.7 predict\_mwl

predict the mean water level

## 10.8 predict\_phase

predict tidal phase

## 10.9 predict\_range

predict the tidal range

## 10.10 rt\_model

select the model for fitting

## 11 river-tide/@River\_Tide\_Hydrodynamics\_Map

hash container for a set of River\_Tide predictions for different boundary conditions

### 11.1 River\_Tide\_Hydrodynamics\_Map

container class to store multiple river-tide scenarios

### 11.2 fun

compute river tide for a scenario with specific boundary conditions  
and store it in the hash,  
or retrieve the scenario, if it was already computed

### 11.3 plot

quick plot of scenario result

```
function obj = plot(obj,Xi,Q0,W0,S0,z1_downstream,cd,zb_downstream,  
    omega,q,opt)
```

## 12 river-tide/@River\_Tide\_IVP

### 12.1 solve

## 13 river-tide/@River\_Tide\_JK

empirical analysis and prediction of river tides by the method of  
Jay and Kukulka

### 13.1 River\_Tide\_JK

## 13.2 damping\_modulus

damping modulus of the river tide  
c.f. Jay and Kukulka  
function r = damping\_modulus(obj,h0,b,Qr)

## 13.3 mean\_level

tidally averaged surface elevation  
c.f. Jay and Kukulka

## 13.4 rivertide\_predict

predict river tide by the method of jay and kukulka  
TODO rename

## 13.5 rivertide\_regress

Regression of tidal coefficients according to Jay & Kukulka  
  
coefficients of the r-regression factor 2 apart for specis (jay C7)  
this can be repeated for each tidal species (diurnal, semidiurnal)

## 13.6 tidal\_discharge

tidal discharge  
c.f. Jay and Kukulka  
function Qt = tidal\_discharge(obj,x,R0,h0,b,Qr)

## 13.7 tidal\_range

predict tidal range

## 14 river-tide/@River\_Tide\_Morphodynamics\_Map

### 14.1 River\_Tide\_Morphodynamics\_Map

container class to store multiple river-tide morphodynamics scenarios

### 14.2 fun

morphodynamics of a tidal river  
either retrieve a precomputed scenario or compute and store a new scenario

## 15 river-tide/@River\_Tide\_Network\_Simple

### 15.1 River\_Tide\_Network\_Simple

tide in a fluvial delta channel network, extension of 1D river tide  
the network is a directed graph  
TODO convert from trig-to exponential form

### 15.2 discharge\_amplitude

discharge amplitude

### 15.3 mean\_water\_level

predict the mean water level

### 15.4 plot\_mean\_water\_level

plot tidally averaged water level

### 15.5 plot\_water\_level\_amplitude

plot surface elevation amplitude

## 15.6 solve

solve for the tide in a fluvial channel network

boundary condition at end points not connected to junctions  
[ channel 1 id, endpoint id (1 or 2), s0, c0  
...  
channel n id, endpoint id (1 or 2), s0, c0]

conditions at junctions are specified as cells  
each cell contains an nx2 array  
n : number of connecting channels  
[channel id1, endpoint id (1 or 2), ...  
channel idn, endpoint id (1 or 2)]

every tidal species for each channel has 4 unknowns  
these are 2x2 unknowns for the sin + cos of left and right going  
wave

## 15.7 water\_level amplitude

predict the surface elevation amplitude

## 16 river-tide/@River\_Tide\_SWE

### 16.1 solve

determine river tide by the fully non-stationary FVM and then  
extract the tide  
this is experimental and not yet fully working

## 17 river-tide

analysis and prediction of river tides

Sub-Classes:

@River\_Tide

- prediction of river tide in a backwater affected river with  
a sloping bed

@River\_Tide\_Cai

- prediction of river tide, method of Cai

```

@River_Tide_Empirical
    - prediction of river tide, empirical
@River_Tide_JK
    - prediction of river tide, empirical after Jay and Kukulka
@River_Tide_Map
    - mulitple-scenaria container for River_Tide
@River_Tide_Network
    - extension of River_Tide to networks

```

### 17.1 damped\_wave\_bvp

solved damped wave equation  
 $z'' + a z = 0$   
 $z(0) = z_0, z(L) = 0$

### 17.2 damped\_wave\_ivp

linearly damped wave in rectangular channel  
 solve tide as initial value problem  
 damped wave approximation

$$z'' + a z = 0$$

$$x_t = Ax + b$$

### 17.3 damping\_modulus\_river

damping modulus of the tidal wave for river flow only

### 17.4 rdamping\_to\_cdrag\_tide

converts damping rate to drag coefficient  
 c.f. friedrichs, ippen harleman

### 17.5 river\_tide\_godin

analytic solution to the river tide formulated as boundary value  
 problem  
 in a river with finite length  
 c.f. Godin 1986

## 17.6 river\_tide\_transport\_scale

## 17.7 river\_tide\_transport\_scale\_5

## 17.8 rt\_celerity

celerity of the tidal wave

## 17.9 rt\_quasi\_stationary\_complex

quasi-stationary solution of the SWE  
TODO staggered grid does not help: q1' needed

## 17.10 rt\_quasi\_stationary\_trigonometric

quasi stationary form of the SWE

## 17.11 rt\_reflection\_coefficient\_gradual

reflection coefficient for gradual varying cross section geometry  
without damping

## 17.12 rt\_transport

## 17.13 rt\_wave\_equation

solve river tide as boundary value problem

```
input:
omega : [nfx1] angluar frequency of tidal component, zero for mean
        flow
reach : [nrx1] struct
.L    : [1x1] length of reaches
        .width(x,h)    width
        .bed(x,h)      bed level
        .surface(x,h)  surface elevation
        .Cd(x,h)       drag coefficient
.bc   : [nd,nf] boundary/junction conditions
        bc(id,if).type : {surface, velocity, discharge} (dirichlet)
        bc(id,if).val  : value
opt    : [1x1] struct
        - constant surface elevation
        - deactivative advective acceleration
        .dx : spatial resolution

dimensions:
nr : nurmber or reaches
nd : upstream/downstream index
nf : frequency index
```

#### 17.14 rt\_z2q

determine tidal discharge from water level for tidal wave

#### 17.15 tidal\_ellipse

tidal ellipse, numerical ode solution

#### 17.16 tide\_slack\_exp

#### 17.17 wave\_number\_tide

wave number of the tide without river flow  
c.f. friedrichs, ippen harleman  
output :  
k : wave number, such that

$$z(t,x) = z_1(t,0) \exp(i(\omega t - kx))$$

re(k) : rate of phase change

-im(k) : damping rate

function [k k\_low k\_high] = damping\_modulus\_tide(omega,cd,h0,az1)

## 17.18 wavetrainz

determine river tide by iterated integration of the surface  
elevation

## 17.19 wavetwopassz

two pass solution for the linearised wave equation, for surface  
elevation

# 18 test/river-tide-hydrodynamics

### **21.3 test\_tidal\_harmonic\_analysis**

## 22 tide

analysis prediction of tides in rivers and estuaries by empirical  
and theoretical methods

### 22.1 tidal\_constituents

### 22.2 tidal\_energy\_transport\_1d

energy transport of a tidal wave

### 22.3 tidal\_envelope

envelope of the tide

```
input : t time in days
        f surface elevation
output: tl time of low water
        vl surface elevation at low water
        ldx index of low water
        th time of high water
        vh surface elevation at high water
        hdx index of high water
        ndx neap index
        sdx spring index
        dmax:
        drange: range per day
```

### 22.4 tidal\_envelope2

surface levelation envelope of the tide  
low water, high water and tidal range for lunar each day

```
input:
    time :
    L     : surface elevation
    order : interpolation order (default 2)
output:
    timei : vector eqispaced
    lmini : minimum level
```

```

lmaxi : maximum level
rangei : range
midrangei : (min + max)/2, usually different from mean
phii : pseudo phase

```

Note: the pseudo phase  $\phi$  jumps, this is because if the tide is semidiurnal, sometimes the lower hw becomes the next day higher than than the current high water, e.g. there is no smooth transition by 51min but a jump by 12h

## 22.5 tidal\_harmonic\_analysis

```

tidal_harmonic analysis

```

## 22.6 tidal\_range\_exp

## 22.7 tidal\_range\_tri

# 23 tide-savenije

## 23.1 savenije\_phase\_lag

```

phase lag of high and low water

phi : u_river/u_tide < 1

delta_eps_hw = omega*(t_hws - t_hw)
delta_eps_hw = omega*(t_lws - t_lw)

c.f. savenije

```

## 23.2 savenije\_tidal\_range

tidal range

based on Savenije 2012

x : distance to river mouth  
eta : range  
eta0 : range at river mouth  
hbar : mean water depth  
phi : velocity ratio  $u_{\text{tide}}/u_{\text{river}}$   
note: this varies in strongly convergent estuaries  
K : mannings coefficient  
I : residual surface slope I

## 23.3 savenije\_tidal\_rangel

tidal range

based on Horrevoets/Savenije, 2004

H0 : tidal range at river mouth  
h0 : initial water depth  
v : velocity scale  
b : convergence length  
sine : phase lag  
K : Mannings coefficient  
Q\_r : river discharge

## 23.4 savenije\_timing\_hw\_lw

time of high water and low water  
c.f. savenije 2012

## 23.5 tide-savenije

# 24 tide

analysis prediction of tides in rivers and estuaries by empirical  
and theoretical methods

24.1 tide\_low\_high\_exp

24.2 tide\_low\_high\_tri
